Project Title: AttendEase System

DESCRIPTION:

Our project caters to two user types: teachers and students. During the sign-up process, users are prompted to provide their credentials along with their user type. Once signed in, the system determines whether the user is a teacher or a student and directs them to the respective dashboard.

For teachers, the dashboard offers various functionalities. Teachers can change their password. They can also view their profile. Complete it by providing personal information.

After completing their profile, teachers have the option to update it as needed. They can select a specific subject from a list of available subjects for which they will be responsible for uploading results.

On the "Upload Result", teachers can view the list of students who have selected them as their teacher for the particular subject they have chosen. They can select a student from the dropdown menu and proceed to upload their results. If there are any changes or updates to the results, teachers can edit the previously uploaded information and save the changes accordingly.

Similarly, students also have access to a set of functionalities on their dashboard. Once signed in, students can change their password. They can also view their profile, which includes personal information and relevant details. After completing their profile, students have the option to update it as needed.

There is an option for them to select up to five teachers. Each teacher corresponds to a specific subject. The dropdown menu will display the available teachers name who specialize in that subject after subject name.

students will be able to view their results only after all the teachers have uploaded the results for their respective subjects. If any teacher has not yet uploaded the result, the system will display a message indicating that the result is not yet uploaded for that particular subject.

USERS:

1. Teacher
2. Student

USER 1:

Username:	hafeez
Password:	123

USER 2:

Username:	wasey
Password:	321
